RESPIRATORY VIRUS Summit

PANDEMIC PREPAREDNESS: WHERE SCIENCE AND POLICY MEET

organised by ESWI
The role of WHO in Pandemic Preparedness Planning

Dr. Maria Van Kerkhove, WHO, Switzerland
What does pandemic preparedness really mean?
The role of WHO in Pandemic Preparedness Planning

Maria Van Kerkhove, PhD
Emerging Diseases and Zoonoses Head
COVID-19 Health Operations and Technical Lead
Epidemic and Pandemic Prevention and Preparedness
WHO Health Emergencies Programme
ESWI, 21 June 2022
Global COVID-19 epidemiological situation (as of 12 June 2022)

- New cases: >3.2 million
- New deaths: 8,737
- Cumulative cases: >533 million
- Cumulative deaths: >6.3 million

Figure 1. COVID-19 cases reported weekly by WHO Region, and global deaths, as of 12 June 2022**
COVID-19 is having a devastating effect on societies... with economic impact far outweighing any previous outbreaks

**COVID has significant affected societies...**

1. Midpoint of estimates by David M. Cutler, PhD, Department of Economics, Harvard University; IMF; McKinsey; and Congressional Research Service, 2 World bank; 3 Market intelligence ; 4 Effect of covid-19 only, UN
... and it will not be the last health emergency

- The risk is increasing due to environmental degradation, rapid urbanization, and international travel & trade
- Increasing humanitarian crisis needs: 160 million people targeted by health cluster across 56 countries
Countries face different situations, challenges and scenarios for ending the emergency phase and for achieving sustained COVID-19 control.
Factors that continue to drive SARS-CoV-2 circulation and impact

<table>
<thead>
<tr>

</table>
SARS-CoV-2 continues to evolve

- Omicron dominant variant of concern (VOC) observed in the context of declining numbers of sequence submitted globally
- Alpha, Beta, Gamma, Delta have declined significantly over time but may still be circulating below detection levels
- Omicron subvariants have the potential to cause waves of infection in countries depending on the background immunity, assessment of their severity as compared to BA.1/BA.2 is ongoing
- BA.4, BA.5 and BA.2.12.1 have increased in prevalence in the last few weeks, however, they remain at a low prevalence globally
- Recombinants, reverse zoonoses are occurring, although the extent is unclear
- **Urgent need to maintain and even enhance surveillance globally**
Strategic objectives to end the global COVID-19 public health emergency in 2022

Reduce and control incidence of SARS-CoV-2 infection

Optimizing national and international strategies and operational readiness

Prevent, diagnose and treat COVID-19

Reduce disease morbidity, mortality and long-term consequences of infection to a minimum

Protect individuals (especially the vulnerable) from exposure and reduce risk of future variants

2022 Planning scenarios

**Base case**
- Virus evolves with severity significantly reduced over time
- Spikes in transmission as a result of waning immunity
- Boosting for high-priority populations
- Seasonal peaks in transmission

**Best case**
- Future variants significantly less severe
- Protection against severe disease is maintained
- Less need for periodic boosting

**Worst case**
- A more virulent and highly transmissible variant emerges
- Vaccines are less effective
- Alterations to vaccines req. & boosting of high-priority groups
Five core components of COVID-19 preparedness, readiness and response: Integration and strengthening actions to address future scenarios

- Integrate COVID surveillance with systems for surveillance of influenza and other respiratory pathogen
- Expand genomic sequencing capacity to increase global coverage
- Maintain & strengthen transmission trend surveillance of cases, deaths, hospital admissions
- Monitor variants and adjust countermeasures as needed
- Scale manufacturing platforms & expanded agreements for technology transfer
- Coordinate procurement & strengthen supply chains to ensure equitable access
- Fully vaccinating most vulnerable and using an optimal schedule of vaccines including boosters.
- Expand social listening systems to facilitate to improve immunization strategies
- Apply context specific public and social measures to reduce risk of spread of the virus
- Strengthen early recognition, triage, safe patient flow and diagnostics to provide timely treatment & resuscitation
- Address gaps infection prevention & control
- Restore essential health services that have disrupted due to COVID
- Integration of COVID-19 into broader health systems and health security strategies & plans
- Coordinated planning, costing & financing across
- Strengthened monitoring and tracking against delivery targets
More than 12 billion doses administered globally, but inequities persist

12.3 billion vaccine doses administered globally as of 14 June 2022

4 billion vaccine doses administered across AMC participants

Strong global vaccine inequity persists – 18 AMC participants have vaccinated less than 10% of the population (compared to 34 in January 2022)

Persons fully vaccinated per 100 population

Note: The designations employed, and the presentation of these materials do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement. There are in total 92 Covax Advanced Market Commitment (AMC) in low and lower middle income countries with special condition to access Covax vaccine doses.

Vaccine delivery challenges and next steps over the coming months

• The window of opportunity to increase vaccination coverage is time bound as countries address competing health priorities and Omicron has changed risk perceptions
  ➢ Support acceleration campaigns in 34 countries in next 3-4 months and use this as an opportunity to strengthen health systems.

• Most of the countries with low coverage rates are dealing with humanitarian emergencies
  ➢ Focus on integration of COVID-19 vaccination with humanitarian activities

• Coverage of healthcare workers, the elderly and people with comorbidities is still low
  ➢ Support countries develop tailored approaches to reach high-priority groups

Support required

• Maintain political attention on COVID-19 vaccination
• Continue to provide flexible delivery funding
• Support the integration of COVID-19 vaccination with humanitarian activities and encourage humanitarian partners to take this up
• Invest in primary health care systems and in local production as key components of pandemic preparedness
Pandemic Preparedness…. Is now.

The global emergency is not over. We are not yet living with COVID-19 responsibly

- Millions (re)infected each week
- 8000+ dying each week
- Billions not fully vaccinated
- Post COVID-19 Condition burden and planning
- Systems, financing, workforce being dismantled
- Public trust low, disinformation rampant, societal unrest increasing
Leveraging data sharing and sequencing capabilities

In March 2021, 105 of 194 WHO Member States had sequencing capacity for SARS-CoV-2. In January 2022, this increased to 132 WHO Member States, representing an increase of 26% of Member States with sequencing capability.

In January 2021, 94 of 194 WHO Member States were publicly sharing SARS-CoV-2 virus sequence data. In January 2022, this increased to 134 WHO Member States, representing an increase of 43% of Member States publicly sharing sequence data.
What is the global genomic surveillance strategy for pathogens with pandemic and epidemic potential?

A 10-year unifying framework to strengthen country, regional and global genomic surveillance.

IT AIMS TO:

- Link and embed pathogen monitoring within broader surveillance systems
- Identify opportunities to strengthen and establish capacities and systems
- Bring partners and stakeholders together to work on a common vision

The Strategy aims to mobilize genomic surveillance efforts against any pandemic or epidemic threat by strengthening and linking laboratories around the world.
National deployment and vaccination plans (NDVP)

NDVP are an important planning tool for countries introducing vaccine during pandemics.

- NDVP required to receive WHO vaccine donation
- WHO guidance and training supported countries to update NDVPs
- NDVP was a requirement for COVAX Advanced Market Commitment countries

Lessons learned from 2009 Influenza and COVID-19 pandemics:
- Having to develop a NDVP at the time of an emergency has slowed down vaccine roll out
- Countries with an existing influenza NDVP were able to adapt for COVID-19 vaccine

Moving forward, updating NDVPs as part of pandemic preparedness planning can help countries prepare for known and unknown pathogens.
Risk communication and community engagement (RCCE)

- Outbreak Communication Guideline (2005)

Influenza A(H1N1)pdm09

- WHO guideline for emergency risk communication (GRC)
- Community engagement
- ECN & SocialNet established
- Strengthening MOH capacities

Inter-pandemic period*

- Platforms introduced: EPI-WIN, Social digital listening
- Infodemic management
- Collective Service
- Applying MOH capacities

COVID-19

Moving forward, building on and strengthening RCCE platforms as part of pandemic prevention, preparedness and readiness planning can help countries prepare for known and unknown pathogens

*Strengthening, learning through outbreaks of MERS, EVD, Zika, plague, Yellow Fever…
Preventing for future SARS-CoV-2 variants and respiratory pathogen epidemics/pandemics

WHO actions

1. **WHO Policy Brief**: guides countries in respiratory preparedness
2. **Simulation exercise**: enables countries to review COVID-19 & pandemic influenza plans, assess gaps and kick-start integrated respiratory pathogen pandemic planning approach
3. **Country engagement**: started through PIP Framework recipient countries, regional initiatives & partner agencies, global SPRP indicator to monitor progress (# countries with updated plans)
4. **Global Partner Forum (45 agencies)**: strengthen coherence
5. **Global guidance & community of practice**: under development

Response & transition

1. Optimize COVID-19 strategies
2. Evolve systems from emergency response posture to prepare for future SARS-CoV-2 variants & other respiratory diseases including disease X

Statement & recommendation

**EC noted** continued importance of WHO’s guidance to support State Parties’ recovery planning & future respiratory pathogen pandemic preparedness

**EC recommended** State Parties strengthen COVID-19 pandemic response plans… inform current & future response and preparedness efforts

Future-proofing: integrated respiratory pandemic planning
COVID-19 and the future of pandemic preparedness and response: A new health threat architecture: if not now when?

- Maintain, strengthen, integrate surveillance systems, sequencing, supported work force, disease management; rebuild trust; be agile

- Fully vaccinate most vulnerable in every country

- Working toward the longer-term goal to develop a Sustainable System for Integrated Epidemic Respiratory Disease Preparedness, Response and Control

- Outbreaks of pathogens of pandemic potential are set to continue to increase in frequency for the foreseeable future. COVID-19 was disease X, and the next disease X is out there.

- Without swift and coordinated action to strengthen the global architecture for pandemic preparedness and response, backed by the necessary financing, the costs of the next pandemic are likely to exceed those of COVID-19.
